

COMICCRAFT

AI-Powered Comic Creation Project

1. Project Title

ComicCraft – AI-Powered Comic Creation System

2. Introduction

ComicCraft is an AI-assisted web application that helps users create comics from simple story ideas. The system supports story outline generation, full narration, scene-based content, image generation, and final comic export as a PDF. It is designed for non-artists, storytellers, and hobbyists who want to turn their ideas into visual stories with minimal effort.

3. Objective

The main objective is to simplify comic creation by combining artificial intelligence with a user-friendly interface. The system converts a user's basic story idea into structured story content and visual comic scenes, reducing the need for advanced writing, drawing, or design skills.

4. Features

- User Story Idea Collection
- AI-based Story Outline Generation
- Full Narration and Dialogue Generation
- Scene-by-scene Story Flow
- AI Image Generation for Comic Scenes
- Story Testing and Consistency Checking
- Sample Story Generation
- Export of the completed comic as a downloadable PDF

5. Technologies Used

Frontend: HTML, CSS, JavaScript / modern web UI technologies.

Backend: Server-side application/API layer for processing requests.

AI: Generative AI for story, narration, and image creation.

Output: PDF generation for the final comic.

The exact framework and API choices can be updated according to the implementation used by the team.

6. System Workflow

1. User enters a story idea.
2. The system processes the idea and generates a story outline.
3. The outline is expanded into full narration and dialogues.
4. The story is divided into scenes/panels.
5. Visual prompts are prepared and images are generated.
6. Story flow and content consistency are checked.
7. Comic pages are assembled.

8. The final comic is exported as a PDF.

7. Team Member Responsibilities

Team Member 1 – Story & Content

- Collect user story ideas.
- Generate and refine story outlines.
- Generate full narration and dialogues.
- Check story flow, continuity, and content quality.
- Prepare sample stories for testing and demonstration.

Other team members

Responsibilities may include UI development, backend/API integration, image generation, PDF generation, and testing/documentation according to the team's allocation.

8. Development Steps

- Define requirements and user flow.
- Design the story input and output structure.
- Implement story outline generation.
- Implement narration and dialogue generation.
- Create scene/panel data structures.
- Integrate image generation.
- Assemble comic pages and implement PDF export.
- Test the complete workflow and refine the outputs.

9. Testing

Testing should verify that user ideas are accepted correctly, outlines match the requested theme, narration is coherent, characters and events remain consistent, generated scenes follow the story, images correspond to scene descriptions, and the final PDF is readable and correctly formatted. Sample stories can be used to test different genres and input styles.

10. Future Enhancements

Future versions can include user accounts, saved comic libraries, multi-page story arcs, editing of individual panels, character libraries, multilingual story generation, collaboration features, improved image consistency, and advanced customization of comic layouts and styles.

11. Conclusion

ComicCraft demonstrates how AI can make comic creation more accessible by connecting story generation, narration, visual generation, and document export in one workflow. The project provides a foundation that can be expanded with more customization, persistence, collaboration, and advanced AI capabilities.
